

CLUTCHTECH

TSB-254 Dampening Valves

This vehicle is fitted with a dampening valve. The purpose of this valve is to improve driver comfort by reducing vibrations through softening the clutch pedal.

After clutch assembly, it is important to correctly bleed the clutch hydraulic system. It is recommended to reverse bleed or vacuum bleed to remove any air trapped within the system. If gear selection is difficult, this may identify a faulty clutch dampener or air trapped within the system.

Alternatively, ACS offers a heavy duty braided line to eliminate the factory dampening valve from the hydraulic system. The heavy duty line will bypass the dampening valve, connecting the master cylinder directly to the slave cylinder. By eliminating the factory dampening valve, a more responsive feeling pedal will be achieved. Please contact your distributor to purchase this part.

Installing this line will increase the pedal feel and give a more positive clutch engagement.
